

Hello,
Our names are Feini,
Anna and Grace

We are students at
Elderslie High School

The challenge that our team is addressing is the loss of employment and drop in employment rates within the manufacturing industry in Camden.

Our project is based upon how we can help employees and businesses within the manufacturing industry get back on their feet during the post-COVID period and the consequential recession.

Through our research on the information available on the manufacturing business of Camden, we were able to establish that there aren't many online sources that could help individuals find jobs within today's digital society. Therefore we came up with the idea of developing an informational website that could provide information which individuals truly need to search and apply for jobs within Camden's manufacturing businesses.

Our solution focuses on creating an interactive and informative website which will be a central source of information that will help individuals prepare for a new job or a transition back to their former job. Our project will provide connections between the individuals and business in the manufacturing industry, to help both job-seeking individuals and businesses to find and retain employment.

The website will also include information regarding courses and workshops for business owners in the Camden area to help them improve their business models and financial planning, and retain employees.

Our project is beneficial to both individuals who seek employment, and businesses/companies who need to hire and retain employees within the manufacturing industry. The local community of Camden and particularly the manufacturing industry will benefit from our website.

Our website includes information on the possibility of a human workforce being replaced by technology, therefore there are features in the website that introduce courses on, and promote economic and occupational sustainability, for both business owners and individuals working within the manufacturing industry.

Through researching about the manufacturing industry, we have gained new knowledge about how STEM could improve and further advance this industry. We have learnt about the importance of reliable and accessible information to individuals, to increase the employment rate for certain industries.
