# Efforts Targeting Developer-to-User Communication

## App Privacy Details on App Store

Q: How can we create a better  
**user-to-developer**  
communication channel of  
privacy concerns?

---

# Hark in a Nutshell

## Review by Hamza Harkous

Reviews are public and editable. Everyone can see your Google Account name and photo. Developers can also see your country and device information (such as language, model, and OS version) and may use this information to respond to you.

Didn't like it

I think this is exploiting my personal information! I had it since 2017, and it recently started asking for weird permissions!

Cancel

Submit

Absolutely amazing. This is so much better than zotero and nasty mendeley. However, one thing the app really needs is the function to continue a single highlight a cross pages. Right now when you highlight text at the bot-  
om continue

**Stop sharing my information!**

**This drains my battery**

**Hide my email in your app!**

**I've been hacked.**

**Undo incognito mode**

**App is offline.**

**I want to hide my name**

**Someone impersonating me**

**You are spying on me!**

**Please remove this device**

# Importance of the User-to-Developer Channel

When developers are made aware of privacy reviews, they carry out related updates [1].

Nudging developers results in reducing unnecessary permissions [2].

There is a correlation between low ratings and negative privacy reviews [3].

*My account was hacked.*

*Location history  
doesn't work*

*Location always  
on but not keeping  
track of timeline.*

*I want a refund as an  
amount was drawn without  
my permission.*

**Not  
privacy**

# Challenge: Tackling Data Imbalance

Imbalanced  
Data

Previous estimates:  
<0.5% of the reviews about  
privacy [1,2].

## Previous approaches [1,2,3,4]:

- Search via keywords/regular expressions (e.g. for “privacy”, “permissions”, etc.).
- Then label data.

## Limitations:

- Model will overfit on the presence/absence of these expressions.

## Our approach:

- Use a Natural Language Inference (NLI) model for retrieving semantically relevant data.
- Guide the retrieval with concepts from a privacy taxonomy.

## Advantages:

- Can generalize well beyond keywords.
- Ensures high coverage of a variety of privacy concepts

# Natural Language Inference

**Natural language inference** (NLI) is the task of determining whether a “**hypothesis**” is true (entailment), false (contradiction), or undetermined (neutral) given a “**premise**”.

Generic NLI Dataset

Premise	Hypothesis	Verdict
Houston is freezing and dry right now.	The city is really <b>humid</b> now.	contradiction
Houston is freezing and dry right now.	The city is really <b>cold</b> now.	entailment
Houston is freezing and dry right now.	The city is really <b>crowded</b> now.	neutral

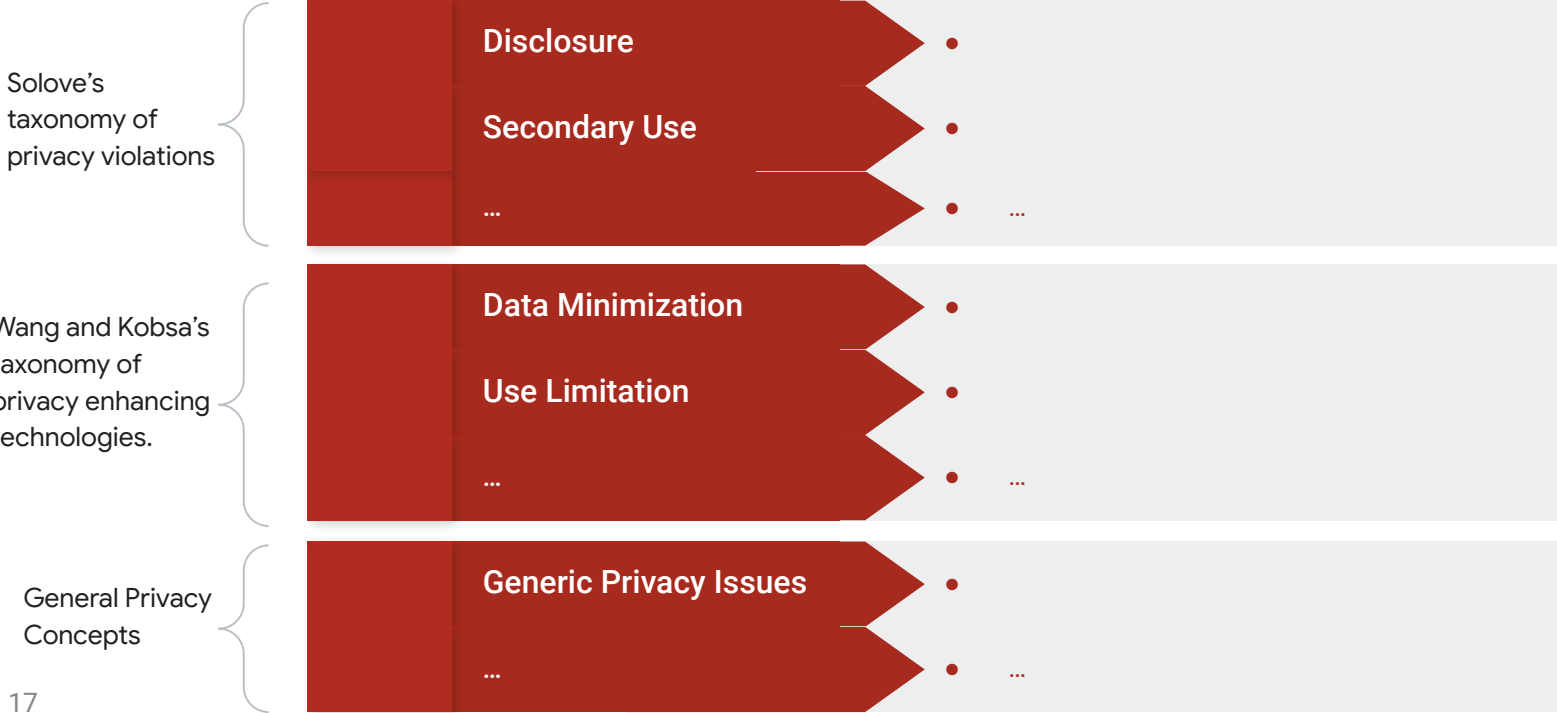

**Idea\*:** Use a generic model trained on NLI datasets to sample data matching privacy hypotheses.

# How Do We Guide Our Data Sampling?

## Target Privacy Concepts

## Hypotheses

# How Do We Guide Our Data Sampling?

## Target Privacy Concepts

## Hypotheses

Solove's taxonomy of privacy violations

Disclosure	• Personal data disclosure is discussed.
Secondary Use	• The user is concerned about the purposes of personal data access.
...	• ...

Wang and Kobsa's taxonomy of privacy enhancing technologies.

Data Minimization	• More access than needed is required.
Use Limitation	• The data is being used for unexpected purposes.
...	• ...

General Privacy Concepts

Generic Privacy Issues	• A data privacy topic is discussed.
	• This is about a privacy feature.
...	• ...

# How Do We Guide Our Data Sampling?

## Target Privacy Concepts

## Hypotheses

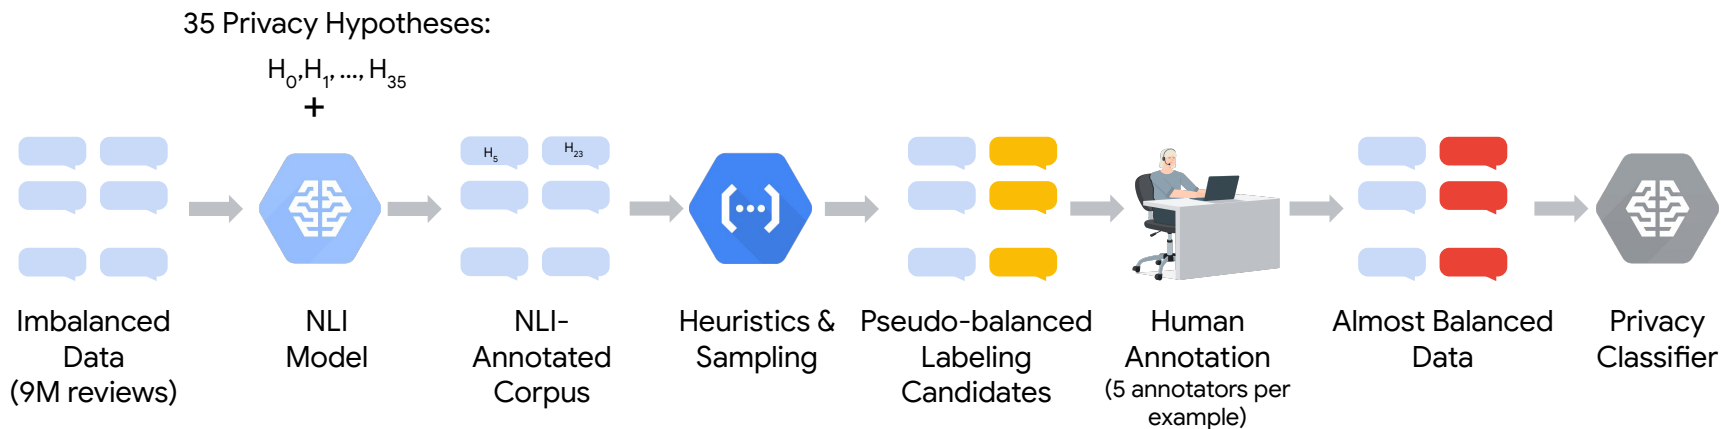

Premises (User Reviews)	Entailment Probability
this game will NOT open unless you agree to them sharing your information to advertisers	0.89
and doesn't ask for access to unneeded personal data permissions. Well done developers 5Stars	0.75
super easy to use it removed my virus . . . perfect	0.01

**Approach\*:** Sample a pseudo-balanced set for labeling containing:

- reviews with high entailment scores for *some* hypotheses (maybe-privacy)
- reviews with low entailment scores for *all* hypotheses (maybe-not-privacy).

# Privacy Classifier Building Pipeline Summary

# Model Training with T5

Model choice: **T5**

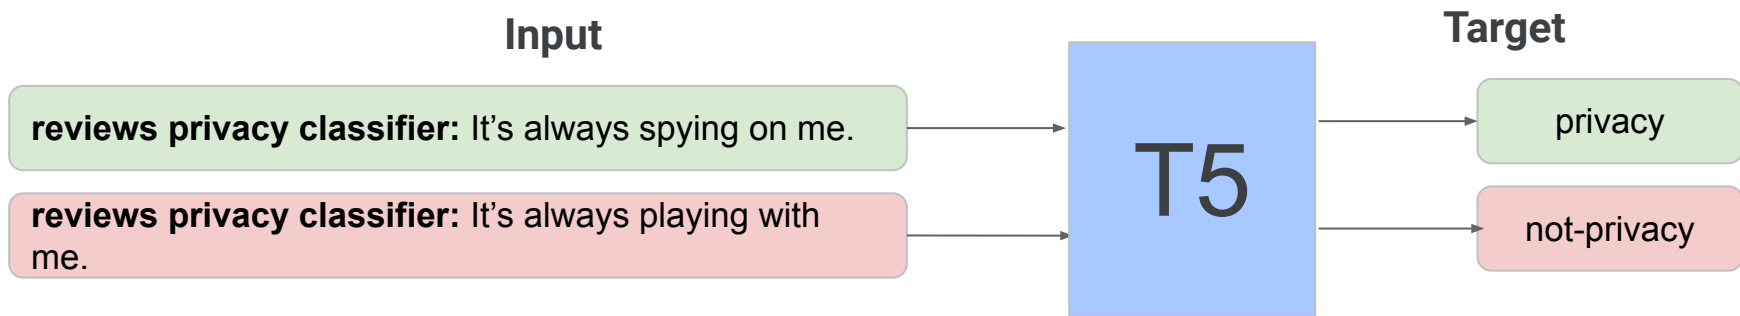

- a unified text-to-text model where the input and output are always text strings
- leading NLU [benchmarks](#)
- simplifies multi-task learning

# Model Training with T5

## Model choice: T5

- a unified text-to-text model where the input and output are always text strings
- leading NLU [benchmarks](#)
- simplifies multi-task learning

# Evaluation Setup

## Training Data Choices:

- **Hark Data:** constructed as described before (2.75K training set, 300 testing set)
- **ICSE Data:** obtained from the work by Nema et al. (ICSE 2022). Data is sampled via a set of regexes, guided by a set of privacy concepts.

## Training Model Choices:

- **T5-11B:** constructed as described before
- **RoBERTa-large:** a 24-layer encoder model, achieving strong results on various classification tasks.
- **SVM:** SVM classifier based on bag of words (using 3-5 character n-grams), reproducing the model used in Nguyen et al. (IEEE S&P 2019).

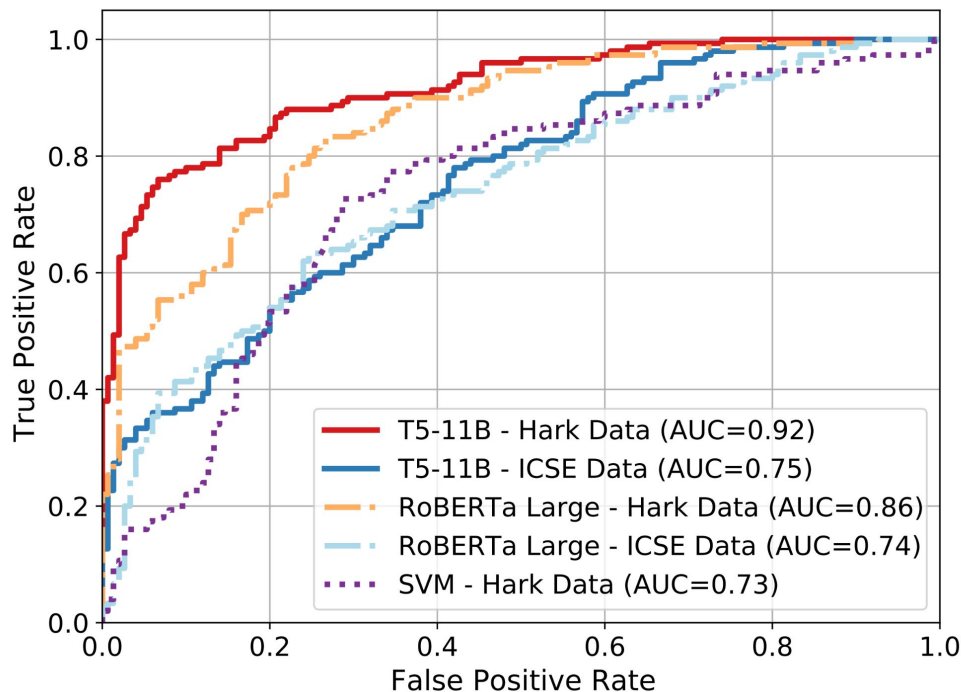

# Privacy Classifier Evaluation (Hark Test Set)

## Data sampling matters:

Training on a well-sampled dataset boosts AUC by 0.17 with T5-11B on Hark's test set.

## Model choice matters:

SVM fails to learn the nuances. Leveraging transfer learning, larger models improve quality with the same training data.

# Privacy Classifier Evaluation (ICSE Test Set)

## **NLI-based sampling has better generalization power:**

- Hark T5-11B had an AUC=0.98 on the ICSE test set.
- It matches the reported SOTA ensemble model trained on ICSE training set in the paper.

# Issue Generation

# Automated Issue Generation (Existing & New)

*This app automatically delete your important files from SD card*

**Unneeded Contact Access**

*Why does it need access to Contacts now ?*

**Hide Photos, Hide Videos**

*Gud app to hide videos & photos*

**Hide Files**

*Nice software to hide your secret files*

*I want a refund as an amount was drawn without my permission.*

# Challenge: Generating Unseen Issues

How can we generate issues (not necessarily seen before) while being:

- concise
- consistent
- fine-grained

## Previous approaches:

- Either rely on classification approaches [1].
- Or rely on extracting key phrases [2,3].

## Limitations:

- Classifiers are limited to a small set of predetermined issues.
- Key phrases don't repeat across reviews.

---

## Our approach:

- Develop a generative model that produces issues in the style of succinct labels (new or seen before).

## Advantages:

- Outputs consistently worded issues that repeat across reviews.
- Accounts for newly emerging issues.
- Issues are easily glanceable.

# Abstractive Issue Generation Approach

Fine-tune the T5 model to generate issue tags given the review text.

# Dataset Creation Strategy

**Data sampling:** We sampled reviews such that:

- We cover a variety of privacy concepts (using our NLI-Annotated Corpus).
- We balance the different app categories and review lengths.

**Training Data Labeling:**

- Two authors labeled each review with a set of issues.

**Training Data Restrictions:**

- Trick: limit the unique issues in the training data to encourage the model to be creative.
- 613 training examples and 447 validation examples.

# Evaluation Setup

## Compared models:

- **Hark Issue Gen:** T5-11B model trained on our dataset (**abstractive, our data**)
- **T5 Wikihow:** T5-11B model trained on an existing public dataset for abstractive summarization of article sections into section titles. (**abstractive, public data**)
- **RE-BERT:** SOTA model for extracting the key phrases representing software requirements in reviews (**extractive, previous work's data**).

## Evaluation data:

- Sample a set of reviews diversified across concepts, text lengths, app categories (600 reviews)
- Generate the outputs from each model.
- Create a crowdsourced evaluation experiment of these outputs.
- Measure:
  - **Issue Accuracy:** how precise each issue is in capturing the intent of the review
  - **Issues Coverage:** how comprehensive a set of issues is in capturing the main topics mentioned in the review.

# Example Outputs

**Review:** *"I love this app but dose my journey and my photos in the map can seen by other users and google map or it is private 🙄."*

**Hark Issue Gen:** Journey Visibility, Photo Visibility

**T5 Wikihow:** Using the Google Maps App

**RE-BERT:** Photos

# Instructions for Human Evaluation of Issue Accuracy

(7 annotators per review, 267 annotators in total)

Consider the following Android app review:

(Reviews are texts submitted by users to share their experience or concerns)

*"I love this app but dose my journey and my photos in the map can seen by other users or it is private 🤔"*

Which of the following best describes each label?

- **Journey Visibility**
  - The **topic is discussed** in the review
  - Contains keywords present in the review, but is **not a topic**
  - **Unrelated** to the review
- **Using the Google Maps App**
  - ...
- **Photos**
  - ...

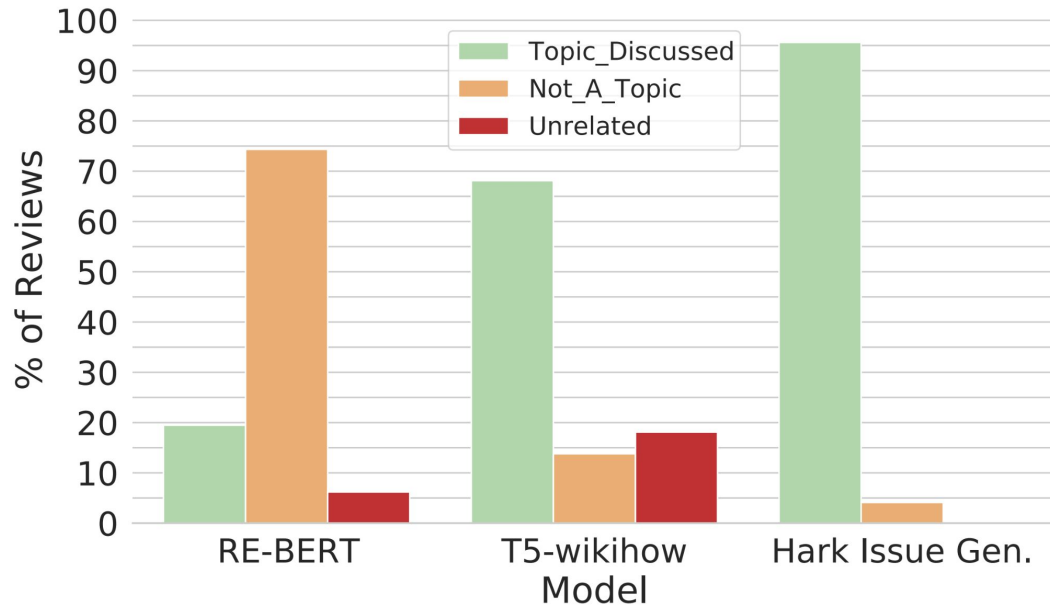

# Issue Generation Accuracy (when N≥5 annotators agree)

## Abstractive models do better.

Even if not targeted for review issue generation, abstractive models achieve better accuracy.

## A custom dataset is a must.

T5-11B trained on Hark's issue generation dataset significantly outperforms that trained on off-the-shelf dataset (96% vs 79% accuracy).

# Theme Generation

# Summarizing the Top Themes

*Nice software to hide your secret files*

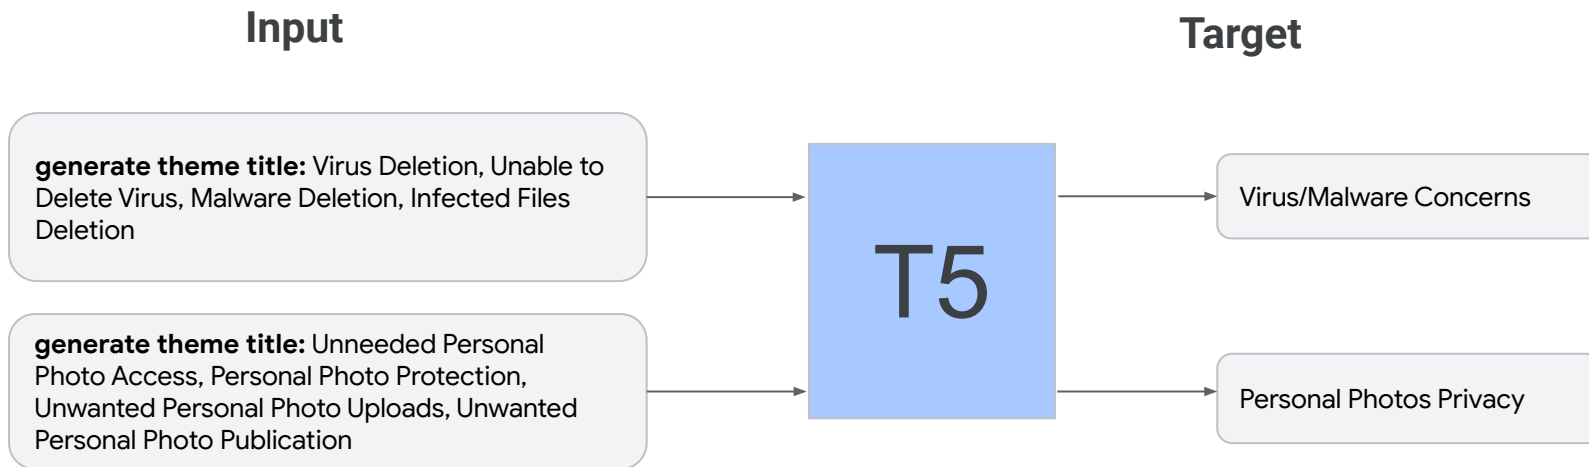

*I want a refund as an amount was drawn without my permission.*

# Theme Generation Overview

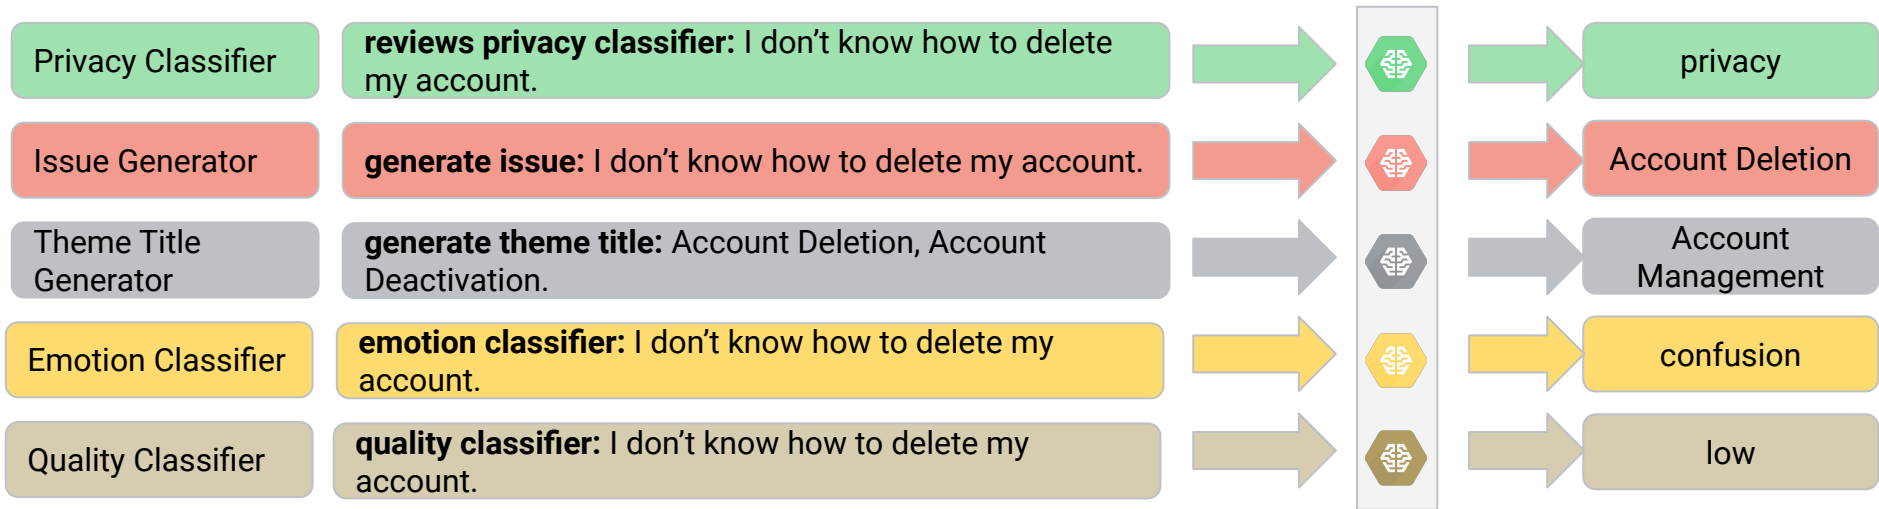

# Abstractive Theme Title Generation Approach

Fine-tune the **T5 model** on a **custom dataset** to generate theme titles from a group of issues.

# Hark's Unified Modeling Paradigm

T5

# Applying Hark Pipeline at Scale

# Analyzing a Large Reviews Dataset

- Applied our methodology to the largest dataset of Play Store reviews to date.
- Illustrated how the Hark methodology allows easily navigating reviews at that scale.

**626M**

Reviews analyzed

**1.3M**

Apps with >10K  
installs and >1K  
reviews.

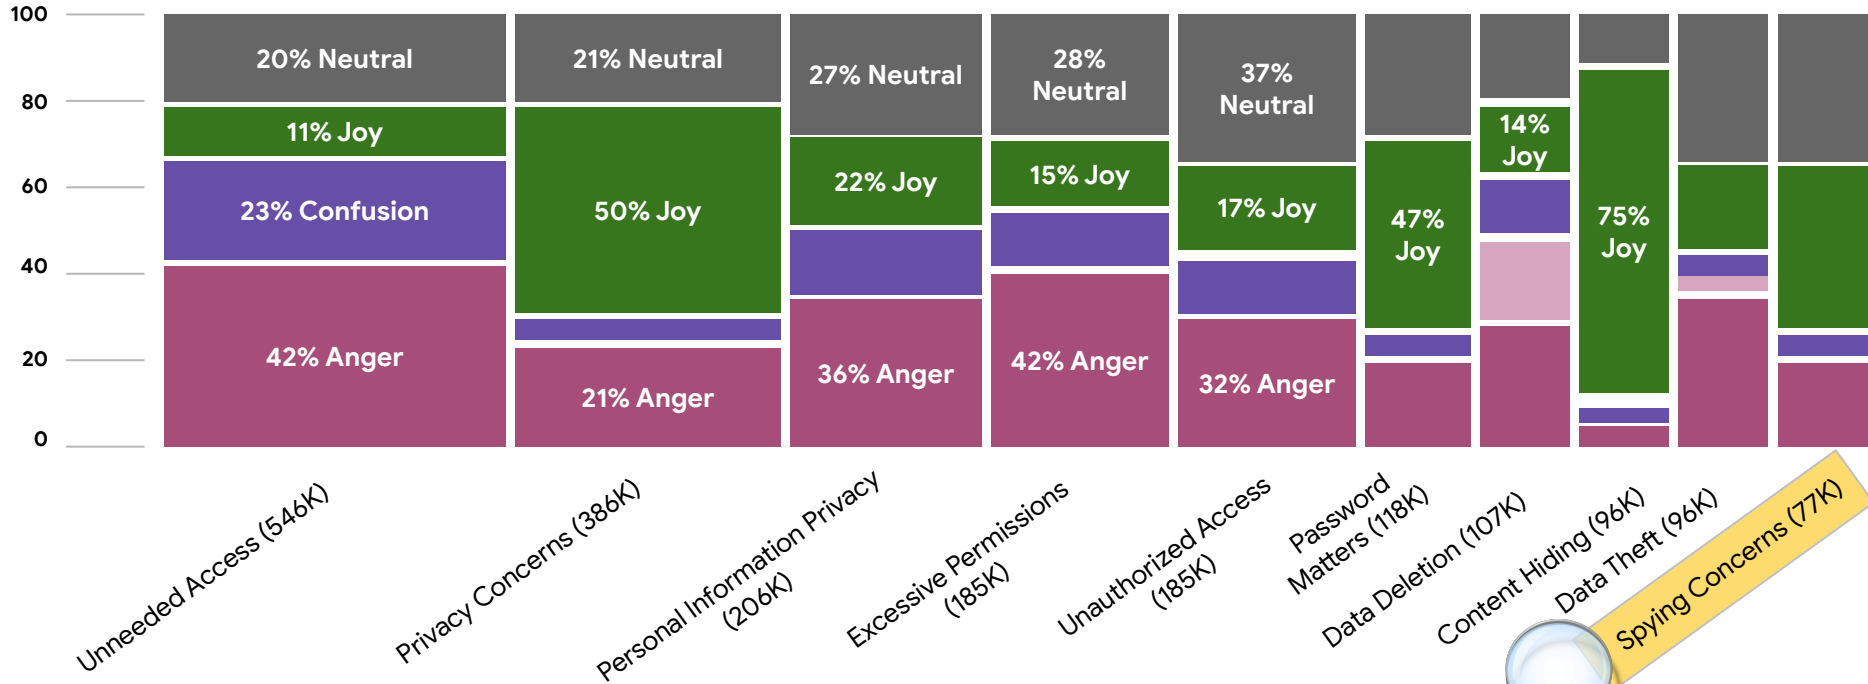

**6M**

Reviews classified  
as privacy.

**>300**

High-level themes  
with >1K reviews  
identified

# Top 10 Themes

# Spying Concerns Theme: Top 10 Fine-grained issues

# Diversified Quotes Within the “Tracking App” Issue

- Neutral** This app tracks everything u do on your smartphone.. Banking the whole nine yards... It has a 25 page privacy disclosure..
- Joy** It has been very accurate. I love how it will give u a history of every time someone has left work/school/home, for how long, and the route they took to get to their destination.
- Confusion** It wants to track and report the sites you visit, and which apps you use—which seems unnecessary and somewhat creepy (...) not sure what these folks have in mind (...)
- Anger** IT'S @@@@ING SPYWARE! The app has become over-reaching in permissions and has become a tracking bot. Everytime I drive by a Walgreens I get coupon notifications.

# Top-5 fine-grained privacy issues in last 5 years

# Summary

Hark is an end-to-end system for extracting and analyzing privacy reviews. It achieves:

- **Topical diversity:** High coverage of the privacy concepts
- **Glanceability:** Developers can understand the gist of the topics without reading all reviews.
- **Navigability:** Developers have a high level picture and the ability to delve deeper into issues.
