

# MER Network Pilot – the power of network science

Suzanne Prober | 23 November 2020

Australia's National Science Agency

Australian Government  
Department of Agriculture, Water and the Environment

# CSIRO project team

## CSIRO core team:

Josie Carwardine

Suzanne Prober

Sam Nicol

Jess Hodgson

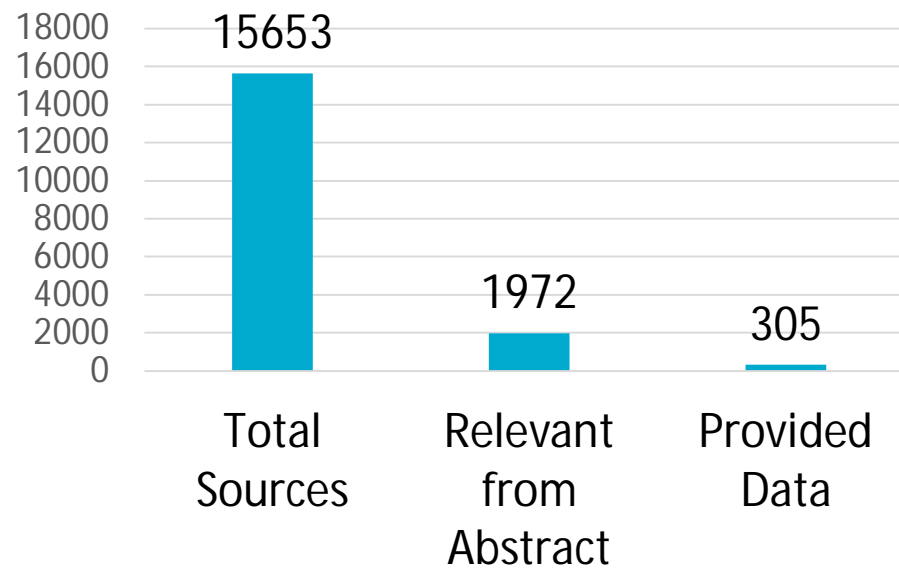

Linda Broadhurst

**Advisory panel:** Iadine Chadés (information science), Shaun Levick (remote sensing), Paul McInerney (aquatic ecosystems), Helen Murphy (rainforests), Chris Pavey (fauna), Gavin Rees (aquatic ecosystems, eDNA), Cathy Robinson (social science), Eric Vanderduys (fauna), Kristen Williams (forests, biodiversity assessment)

# Knowledge Bank of Management Effectiveness

- Total volume of accessible direct evidence for effectiveness of management actions is surprisingly low

# Griffith report

A long-term monitoring framework for  
the Regional Land Partnerships Program

Stage 2

FINAL REPORT

February 2020

# Platform for Ecological Restoration Research Infrastructure (PERRI) Discussion Paper

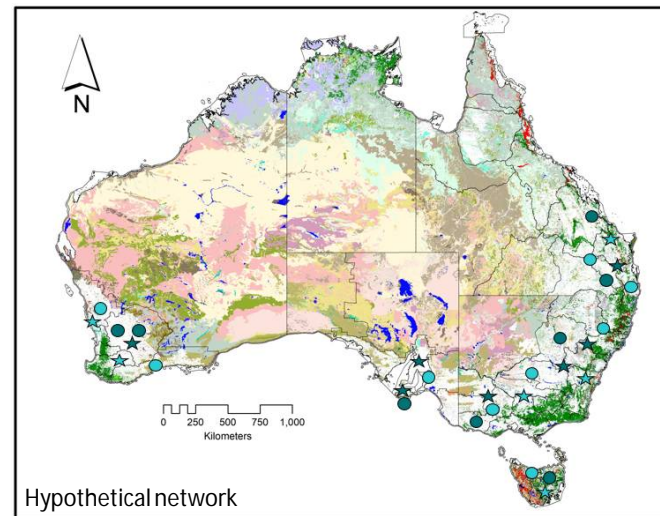

Suzanne Prober, Linda Broadhurst, Guy Boggs, David Bush, Jasmyn Lynch, Martin Breed, Fiona Dickson

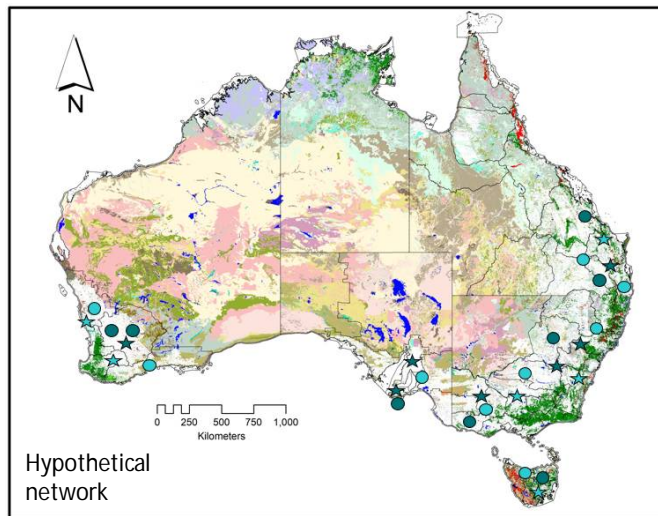

# MER Network concept

Build co-ordinated, nationally distributed, embedded research infrastructure, specifically designed to answer key questions on ecological recovery and management effectiveness.

e.g. Revegetation plantings

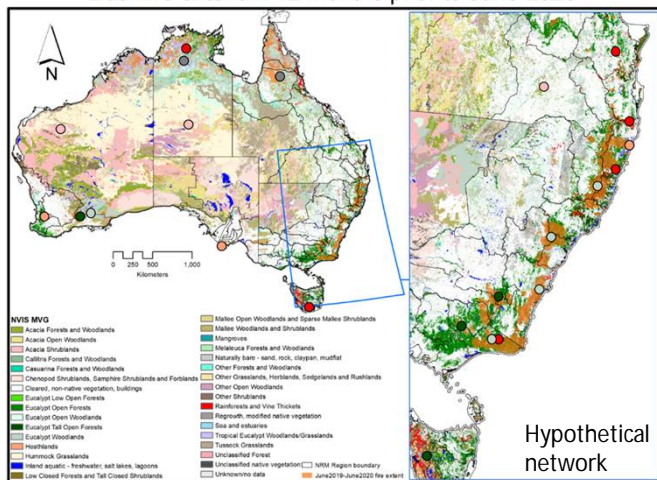

### Potential themes

- Climate adaptation (provenancing, species selections, species diversity)
- Species and functional diversity
- Establishment technologies

## e.g. Post-fire recovery

Bushfire extent in 12 months prior to June 2020

## Potential questions

- What are the responses of vegetation communities, threatened species, and habitats to unplanned bushfire across space and time?
- Where have ecosystems crossed thresholds?
- Have interventions implemented through RLP actions minimised the impact of unplanned bushfires on RLP outcomes?

## Embedded national monitoring infrastructure: Why?

- **Question focused:** designed answer key NRM questions
- **Embedded:** to capitalise on existing effort and answer questions in real world environments

# Embedded national monitoring infrastructure: Why?

- **Question focused:** designed answer key NRM questions
- **Embedded:** to capitalise on existing effort and answer questions in real world environments
- **Distributed network experiments:** powerful tools to answer ecological questions at local to global scales

**Nutrient Network: A Global Research Cooperative**

e.g. Nutrient Network: A decade of insights into grassland ecosystem responses to global environmental change.

# Embedded national monitoring infrastructure: Why?

- **Question focused:** designed answer key NRM questions
- **Embedded:** to capitalise on existing effort and answer questions in real world environments
- **Distributed network experiments:** powerful tools to answer ecological questions at local to global scales
- **Shared knowledge development:** better link science with decision making and on-ground practice

## Embedded national monitoring infrastructure: Why?

- **Question focused:** designed answer key NRM questions
- **Embedded:** to capitalise on existing effort and answer questions in real world environments
- **Distributed network experiments:** powerful tools to answer ecological questions at local to global scales
- **Shared knowledge development** to better link science with decision making and on-ground practice
- **Addresses multiple needs:** evaluation, learning, surveillance

## Embedded national monitoring infrastructure: Why?

- **Question focused:** designed answer key NRM questions
- **Embedded:** to capitalise on existing effort and answer questions in real world environments
- **Distributed network experiments:** powerful tools to answer ecological questions at local to global scales
- **Shared knowledge development** to better link science with decision making and on-ground practice
- **Addresses multiple needs:** evaluation, learning, surveillance
- **Accessible data:** link with existing long-term data facilities (e.g. TERN, DAWE) and access to all

## **Why get involved?**

**Help ensure the pilot is designed to answer the most relevant questions or facilitate implementation**

**Influence the effectiveness of national investments to solve ecological challenges**

**Learn about the effectiveness of management at your own sites or study systems**

**Share knowledge and network with others**

**Progress ecological research, policy and management practice in NRM**

## **Ways to be involved**

**Contribute to planning workshops**

**Establish a monitoring site and contribute data**

**Measure new things across established sites**

**Come up with new questions to ask of the data**

**Analyse data**

**Write or contribute to publications**

**How does the network  
fit in with what I am  
doing?**

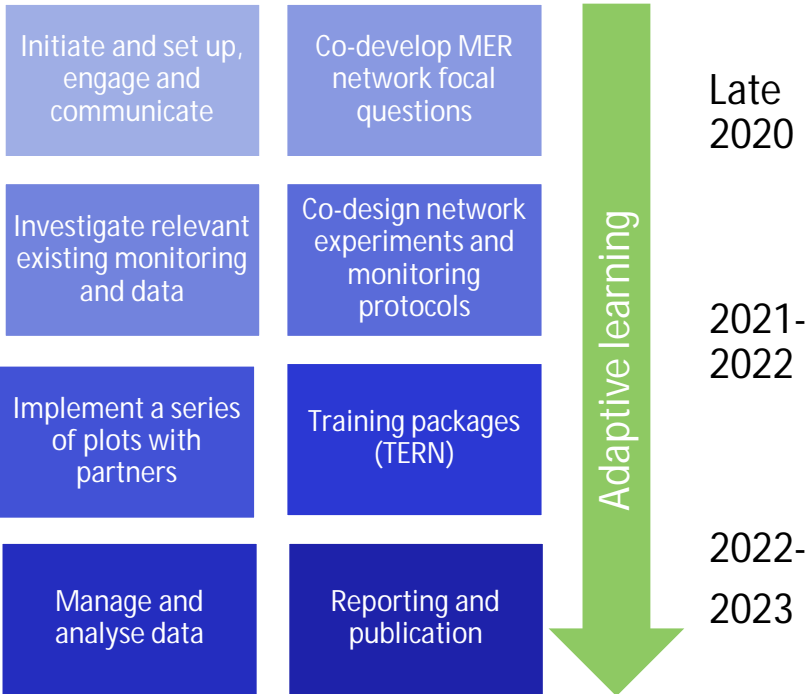

**We acknowledge all the  
important existing work  
on management,  
monitoring, evaluation  
and research across  
Australia**

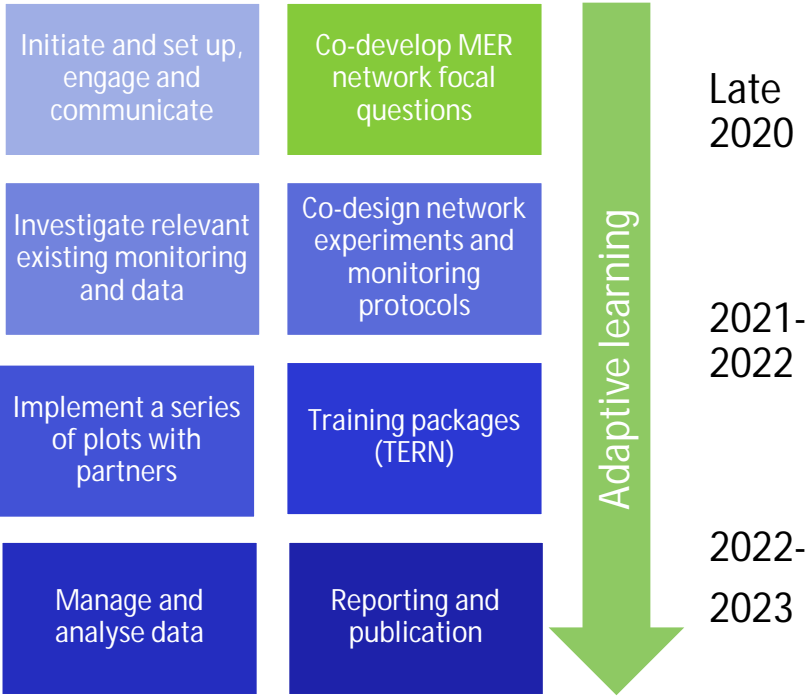

**The network aims to bring out even more benefits of existing efforts and nest within the diversity of ecological assets and local values at sites**

# Project stages

# Project stages

## Broad themes for monitoring questions

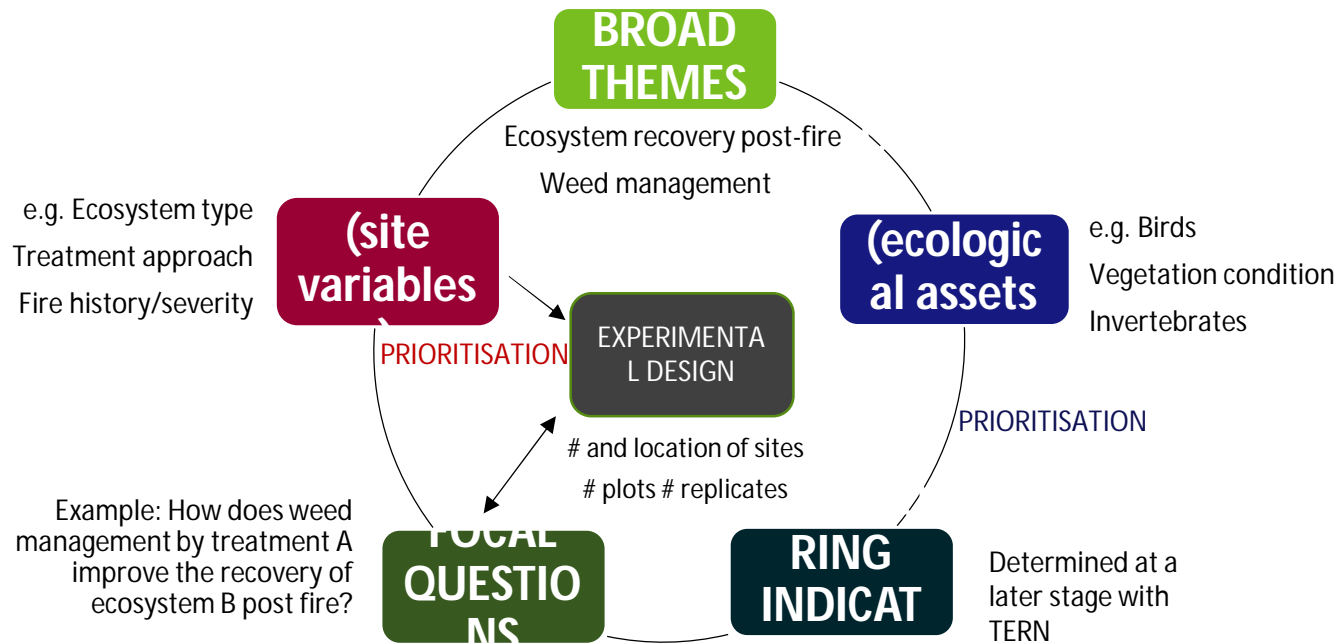

### 1. How do ecosystems recover post-fire?

- E.g. Comparison of burnt/un-burnt areas

### 2. What is the (relative) effectiveness of management interventions to control weeds after fire?

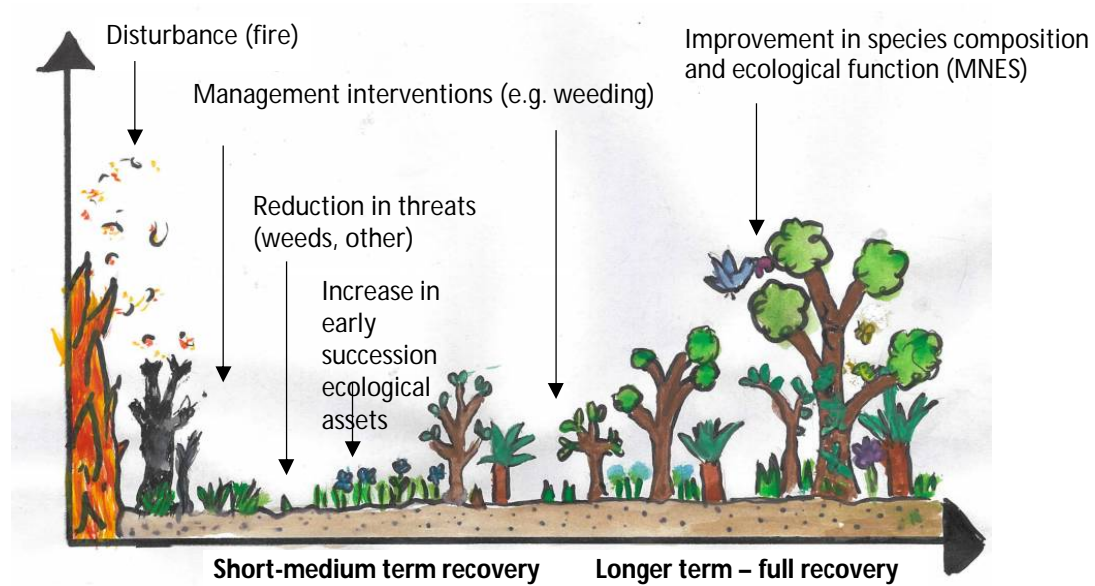

- E.g. comparisons within burnt areas of:
  - weed management vs no management
  - weed management under some range of site variables

# Process for MER pilot network question design

## Recovery of ecosystems – e.g. post-fire weedy ecosystem

- ❖ Consider the ecological assets that are important in measuring the short- and longer-term time frames of ecosystem recovery

# Ecological assets (outcomes) – brainstorm session

- ❖ Which ecological assets are important to monitor in post-fire ecosystem recovery?
- ❖ Which ecological assets are important to monitor for weed management?
  
- ❖ Try to keep this high level – specific monitoring indicators and protocol will be determined later
- ❖ More detailed input can be provided by emailing [MERPilot@csiro.au](mailto:MERPilot@csiro.au)

## Ecological assets - examples

Native plant cover  
Vegetation structure  
Ants  
Invertebrates  
Birds  
Plant composition  
Cultural species  
Threatened species

## Drivers (site variables) – brainstorm session

- ❖ What site variables impact the effectiveness of weed management?
- ❖ What site variables impact the effectiveness in post-fire ecosystem recovery?
- ❖ Experiments in the pilot network could potentially investigate the effect of these variables (some examples below)
- ❖ More detailed input can be provided by emailing [MERPilot@csiro.au](mailto:MERPilot@csiro.au)

Site context	Threats	Target weed characteristics	Weed management intervention	Other management Intervention
Ecosystem type	Invasive plants	Woody Non-woody Aquatic	Mechanical Chemical	Replanting
Ecosystem starting condition	Changing fire regimes		Intensity – on site	Supplementary feeding for wildlife
Weather	Invasive animals	Transformer Non-transformer	Frequency Extent – spatial coverage	Limit disturbance (e.g. grazing)
Time since fire	Invertebrate outbreaks and disease	WONS		Cultural burning
Recent fire severity	Climate change			

Thank-you
